Abstract: Investing in renewable energy (RE) has been one of the main national strategies for American economic recovery and gaining world competitiveness. RE technologies and efforts have progressed at high levels in the last few years, in spite of many challenges in the economy, business models, environment, public policy, and people’s habits and cultures. But, where is the USA on the world stage? Are we globally competitive now and/or in the future? What are Louisiana’s position and efforts in this arena? This lecture will focus on RE as a paradigm shift in our economy, business, education, and culture.
